MEDICAL ONCOLOGY PLATFORM

A Medical Oncology Web Portal Based Platform to Accommodate Bundles and FFS Payments

The eviCore healthcare platform allows providers to manage bundles and FFS cases without having to go back and forth between different portals

- It is structured around proprietary software systems that allow for rapid inclusion of new criteria for management
- This is important since bundles will often initially be rolled out for only a limited number of diagnoses or conditions, and the providers will continue to operate in the FFS world for much of what they do
- The platform is battle-tested, now being used by the vast majority of oncologists in the country
- The platform has been praised by oncologists for *ease of use, speed, adherence to NCCN criteria and intent*

MEDICAL ONCOLOGY PLATFORM

A Medical Oncology Web Portal Based Platform to Accommodate Bundles and FFS Payments

Platform is agnostic to the structure and source of the bundles

Can accommodate third party bundles to include the clinical features of their structures

The structure of the platform allows us to enumerate the clinical features of the bundle in order to audit the providers in the bundles program to ensure that appropriate services were delivered

Platform can communicate with a claims system to trigger the payment workflow for bundles and to block FFS payment for bundled services

- Can link to the institutional services component of the bundles
- Can coordinate other aspects of care such as Hospice, end of life, etc.
- Can provide critical parameters for care or case management services
