Quality
of Life

“With similar accuracy to expensive computer-generated risk models the WMI guides the delivery of services to patient categories based on their risk for subsequent costly health care”.

Wasson JH, Ho L, Soloway L, Moore LG (2018) Validation of the What Matters Index: A brief, patient-reported index that guides care for chronic conditions and can substitute for computer-generated risk models. PLOS ONE 13(2): e0192475.

<https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0192475>

**Retrospective, Long Latency Computerized “Risk” Models
Identify Proportionally More (37% vs 18%) ...
But Miss Many (n =1349)**

Cutoff for a Computerized “Risk” Model	Any Hospital Use During Next Year
Highest (10%) “Risk” Decile	358 (<u>37%</u>)
Lower (90%) “Risk” Deciles	<u>1349</u> (18%)

Of 8619 Medicaid Patients With Chronic Conditions

Retrospective, Long Latency Computerized “Risk” Models Are Agnostic to Current Patient-Reported Risks*

Cutoff for a Computerized “Risk” Model	Number With WMI \geq 2
Highest (10%) “Risk” Decile	659 (<u>68%</u>)
Lower (90%) “Risk” Deciles	<u>3939</u> (52%)

* Patient Reported Risk exemplified here by a WMI \geq 2.

The false negative rate of patient-reported risk is six times greater (3939) than those (659) who fell into the highest decile by the computerized risk model.

A Common Reaction: Why not hybridize retrospective computerized risk models with the WMI?

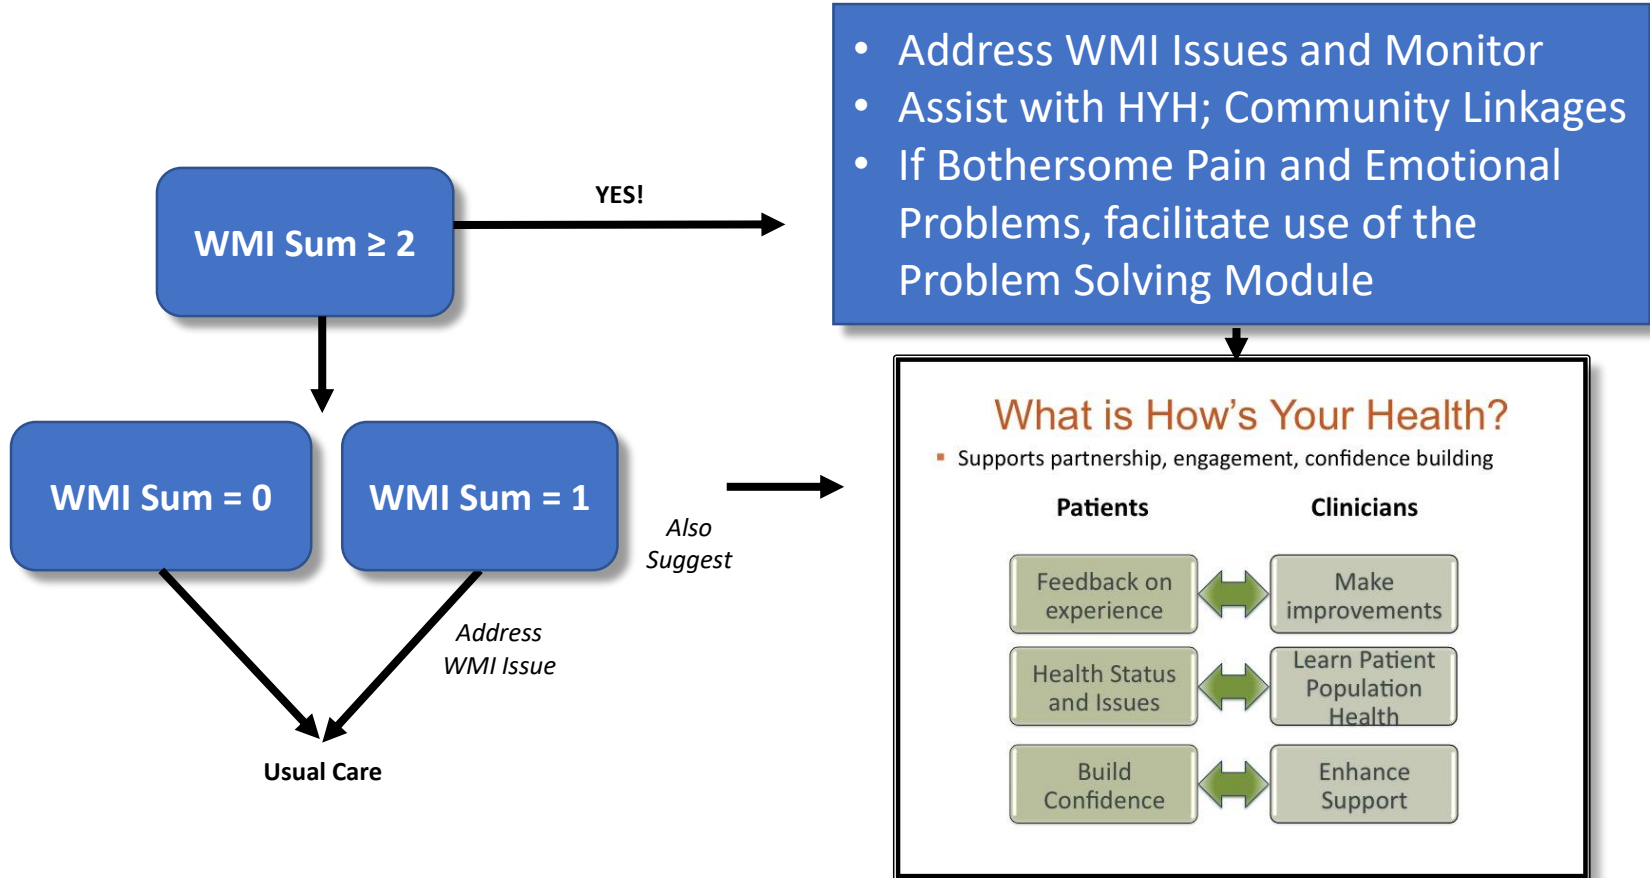

- **Combining two data sets is a costly challenge**
- **It doesn't increase accuracy very much**
- **Large numbers of false negatives remain**
- **Unless a screening WMI takes precedence, hybridization will be agnostic to the many false negative patient who have a $WMI \geq 2$**

Thus the central question of this session:

Why listen to the outdated noise from a computerized risk model (and its touted predictive analytic output) when a timely signal from the What Matters Index is so easy to hear?

Self-Reported Adverse Events In Past Year

(Unnecessary Emergency Department or Hospital, Harms or Medication Side Effects)

For 46 Clinical or Regional Settings

Bottom Line:

The What Matters Index

**Points To Where Management Matters
(And Efficient “Next Steps” As Well)**

In summary, a hypothesis that health services should engage every patient in the management of common, self-reported, essential needs seems a stronger and more ethical foundation for high-value health care than the current, widely accepted one that more care should be offered to an inaccurately designated few.

This truly patient-centered method also overcomes the inadequacies of the current paradigm that health care executives most frequently cite, namely, high direct costs, the need for sophisticated technology or specialized employee training, potential regulatory challenges, and the burdens of either insufficient or excessive data.

We Have The Need

(Retrospective Data Gathering and Crunching
Is Very Costly In So Many Ways)

*Sorry to bother you, Doctors,
but might you have time to
see any patients today?*

**Decreeing Measures
That Don't Matter**

Handout

Ask Yourself These Five Questions to Improve Your Health and Health Care

During the past 4 weeks, how much have you been bothered by emotional problems such as feeling anxious, depressed, irritable, or sad?				
Not at all	Slightly	Moderately	QUITE A BIT	EXTREMELY
During the past 4 weeks, how much bodily pain have you generally had?				
No pain.	Very mild pain.	Mild Pain	MODERATE PAIN	SEVERE PAIN
How many different prescription medications are you currently taking more than three days a week?				
None	1-2	3-5	MORE THAN 5	
Do you think that any of your pills are making you sick?				
YES	No	MAYBE, I AM NOT SURE	I am not taking any pills	
How confident are you that you can control and manage most of your health problems?				
Very confident	SOMEWHAT CONFIDENT	NOT VERY CONFIDENT	I do not have any health problems	

INSTRUCTIONS:

- ✓ Pick the one answer that describes you best for each of the five questions.
 - ✓ Whenever your answer is in **BIG PRINT**, give yourself one point. You can have at most 5 points and at least, no points.
 - ✓ Add up your points. People with a sum of two or higher have an increased risk of using the hospital or emergency room during the next year. Therefore, they need to make sure that doctors or nurses are aware of the needs and that they have good communication with all health professionals. They also benefit when they complete full check-up using www.HowsYourHealth.org and bring the results (the Action Form) to their clinical appointments. HowsYourHealth also automatically creates a personal health record that can be used to keep track of their progress.
 - ✓ A person with a sum of one should consider taking similar action as a person with a sum or two or more.
 - ✓ If you are **SOMEWHAT OR NOT VERY CONFIDENT**, ask yourself “what would it take for you to be able to say that you are very confident that you can control most of your health problems during the next two months?” Write that plan here and share it with someone who can help you.
