

Electronic Health Records in Physician Practices: Overview

Robert H. Miller, PhD

**Institute for Health & Aging
University of California San Francisco**

millerr@itsa.ucsf.edu

November 2004

Background

- ◆ Lot of interest in EHRs as tool for quality improvement
- ◆ Administration goal: “personal” EHRs by 2014
- ◆ Different sectors making different progress
 - ◆ Hospitals: some progress on CPOE/EHRs
 - ◆ Large groups: substantial
 - ◆ Small groups: limited
 - ◆ Community health centers: some early adopters
- ◆ Limited information on EHRs

EHR: electronic infrastructure for major ambulatory care activities

- ◆ Viewing data
 - ◆ Ordering prescriptions, labs, referrals
 - ◆ Messaging with providers
 - ◆ Documenting encounters
 - ◆ Prevention and care management--forms
 - ◆ Analyses, reports—on patients, provider performance
 - ◆ Patient/provider messaging/e-Health (reminders, interactive patient data entry)
 - ◆ Coding assistance for billing
- EHR capabilities varied by vendor, practice

Objective

- ◆ **To describe EHR costs, benefits, and factors affecting costs and benefits in physician groups**
- ◆ **To outline critical policy issues**
- ◆ **Co-Investigator: Ida Sim, MD, PhD**

Methods

- ◆ Design: Cross-sectional qualitative study
 - ◆ Used semi-structured interview questionnaire
 - ◆ Qualitative methods best for study of emergent phenomena
- ◆ Purposeful samples of physician groups with EHRs
 - ◆ 9 large medical groups (>70), 18 solo/small groups (<10), 3 medium
- ◆ Funding: Robert Wood Johnson + CHCF
- ◆ Some info from related on-going EHR work
 - ◆ Tides Foundation + Commonwealth Fund
- ◆ Data from interviews with EHR leaders
 - ◆ 90 interviews, >80 hours of taped data
- ◆ Identified themes, patterns across groups

Key surface barriers to EMR adoption

- ◆ High initial costs
 - ◆ Costs \$16k to \$36k+/doc + initial productivity loss
- ◆ Slow & uncertain financial benefits
 - ◆ None to \$20k/doc/year (i.e., \$5/visit)
 - ◆ Must cover added on-going costs as well
 - ◆ Depend heavily on provider use
- ◆ Extra initial physician time costs

Barrier: High initial cost

- ◆ Initial costs: \$16k-\$50k/provider; median: 30k
 - ◆ \$+ revenue losses due to lower initial productivity
- ◆ Hardware + Software: large & obvious
- ◆ But other costs also important
 - ◆ Vendor installation costs
 - ◆ Remote hosting—if subscription model
 - ◆ Information services staff, contractors
 - ◆ Training--trainers, travel, lost time
 - ◆ Temporary implementation staff
 - ◆ Lost productivity--Potentially large
 - ◆ Management time—opportunity costs
- ◆ On-going costs about 30% of initial costs

Barrier: Uncertain financial benefits

- ◆ \$ benefits varied greatly: none to >\$20k/physician
- ◆ Personnel savings varied greatly
 - ◆ Medical records and transcription, data entry savings possible: needs electronic documenting, electronic data exchange
- ◆ Revenue enhancement varied greatly
 - ◆ Electronic documenting → needs tight PMS integration, P4P
- ◆ Other potential financial benefits more difficult
 - ◆ Efficiency: many small changes in staffing
 - ◆ Space, supplies: small % of total; Utilization: if capitated
- ◆ SO: EHR financial risks slows adoption

Greater physician use → benefits

- ◆ Efficiency: savings from medical records, transcription, data entry staff reductions
- ◆ Revenue: better coding, service capture
 - ◆ More benefit from P4P
- ◆ Quality: better prevention, care management
- ◆ As important as CPOE use in inpatient

Physician EHR use varied

- ◆ Most providers kept electronic lists
- ◆ Some dictated progress notes
- ◆ Many used free text data entry
 - ◆ But not disease-specific templates (electronic forms)
- ◆ Some used basic templates based on guidelines
- ◆ Few used advanced templates
 - ◆ prompts & reminders, coded data
- ◆ Few used analysis & reporting (tracking) capabilities

Barrier: High initial provider time costs

- ◆ Many time-consuming tasks initially
 - ◆ To enter past data
 - ◆ Develop templates, documentation shortcuts
 - ◆ Generally ascend learning curve
 - ◆ Redesign workflow, tasks + more
- ◆ Some providers spent more time at work for months, years
 - ◆ → longer workdays and/or fewer patients seen (less income) → barrier to further use and benefits

Underlying barriers to use, benefits

- ◆ EHR technology challenging to use
 - ◆ Usability affects provider time; but proficiency goes up
 - ◆ Some good systems; bad systems = game over
 - ◆ No silver bullet—gradual improvement over time
- ◆ Electronic data exchange is inadequate
 - ◆ Lot of paper in/out small practices
 - ◆ Increases time costs—parallel processes
- ◆ Provider attitudes are mixed
 - ◆ Spectrum, improving over time

Underlying barriers (2)

- ◆ Financial incentives for QI lacking
 - ◆ “Pay for performance” very limited
 - ◆ Incentives vital to reimburse initial time, \$ costs
 - ◆ Incentives focus leadership, provider attention
- ◆ Complementary innovations/changes difficult
 - ◆ Hard to use EHRs “out-of-the-box”
 - ◆ Technical support, workflow redesign, software customization, chronic care programs all needed
 - ◆ Can increase benefits, reduce time costs
 - ◆ BUT challenging, time-consuming initially

Organizational resources affect EHR changes, use, benefits

- ◆ Info systems staff expertise
- ◆ Management expertise
- ◆ Leadership & governance
- ◆ Experience with past process change
- ◆ Financial capital

Other factors:

- ◆ Type of payment (e.g., capitation, P4P)
- ◆ Affiliations

Smaller groups often lacked needed organization resources

- ◆ Large groups tend to have needed resources
- ◆ Medium-size groups (e.g., 10-40 providers)--vary in resources
- ◆ Small/solo groups (<10 providers)--fewest resources
- ◆ Most community health centers are medium or small in size, with limited resources
- ◆ How to help such organizations?

Policy changes can help EHR adoption, use for quality

- ◆ Financial incentives for QI
 - ◆ “Pay for performance” (P4P) focuses attention
 - ◆ Stimulates demand for support services
- ◆ Funding for support services organizations
 - ◆ To help with technical support, complementary change
- ◆ Community-wide electronic data exchange
 - ◆ Helps small groups most; data from ALL providers
- ◆ Funding for product comparisons, research
 - ◆ Dearth of information on what “works” & why

Community health centers: Same policy changes and....

- ◆ Capital financing
 - ◆ Access to capital
- ◆ Support for member-controlled application service providers (like CHAN), other collaboration
 - ◆ Builds on history of CHC collaborative efforts

Conclusions

- ◆ EHR costs substantial & immediate, benefits slowly emerge
- ◆ Provider use is a key driver of EHR benefits
- ◆ Must be “smart” to generate benefits → complementary changes important
- ◆ Policy changes can hasten EHR use for quality improvement, efficiency

Thank you!
