Using Predictive Modeling to Target Interventions

Barry P. Chaiken, MD, MPH Chief Medical Officer ABQAURP - PSOS

Overview

Cost and Quality Trends

- Disease Management and Modeling
- Predictive Modeling Fundamentals
- Accuracy of Models Case Study

Change Per Capita In Health Care Spending and GDP

* Data for January through June 2003, compared with corresponding months in 2002

<u>Source:</u> B. Strunk and P. Ginsburg, "Tracking Health Care Costs: Trends Stabilize But Remain High in 2002," *Health Affairs* (Web Exclusive June 11, 2003); B. Strunk and P. Ginsburg, *Tracking Health Care Costs: Trends Slow in First Half of 2003*, Center for Studying Health System Change, December 2003.

Growth in Per Enrollee Premiums and Benefits

* Data for growth between Spring 2002 and Spring 2003

<u>Source:</u> Heffler et al., "Health Spending Projections for 2002-2012," Health Affairs (Web Exclusive February 7, 2003) for 1985–2001; Employer Health Benefits 2003 Annual Survey, The Kaiser Family Foundation and Health Research and Educational Trust, September 2003 for 2002–2003.

Drivers of Care Management

- **50% preventive care**
- 30% lack recommended acute care
- 40% lack recommended chronic care
- 30% receive contraindicated acute care
- 20% receive contraindicated chronic care

Recommended Care and Quality Varies

Percent Receiving Recommended Care

Overview

Cost and Quality Trends

- Disease Management and Modeling
- Predictive Modeling Fundamentals
- Accuracy of Models Case Study

DM Defined

"Knowledge-based process intended to improve continuously the value of health care delivery from the perspectives of those who receive, purchase, provide, supply and evaluate it."

--James B. Couch, MD

DM Criteria Specific

- High dollar and volume
- Preventable complications
- Short time frame for results
- Treatment variability
- Extensive patient non-compliance
- Practical guidelines
- Measurable quality metrics

Identify patients

- Develop therapeutic programs
- Improve outcomes
- Achieve acceptable cost levels
- Provide evidence based care

Spectrum of Care

Disease Management

Lower Costs	Higher Costs
	/

Self-Directed	Primary	Secondary	Tertiary	Long Term Care
Patients Provider Home Care	PCP Allied Health Professionals	Specialist Outpatient Clinics	Hospitals Centers of Excellence	Institutions Long Term Care Nursing Homes

Risk Measurement Pyramid

Population Segment

Overview

- Cost and Quality Trends
- Disease Management and Modeling
- Predictive Modeling Fundamentals
- Accuracy of Models Case Study

Predictive Modeling Defined

Use of clinical information available for all members of a population to predict future healthcare needs, overall or for specific types of services.

Reasons for Predictive Modeling

- Existing high utilization by the few
- Uses available data to identify high-risk
- Allows intervention early in disease cycle
- Enhances case and disease management

Predictive Modeling Focus

Case management targeting

- Identify persons for care programs
- Disease management risk stratification
 - Intensity tiers
- Financial forecasting
 - Actuarial risk

What Predictive Modeling Does

Stratify members

- Enhance impact of interventions
- Probabilistic identification of high utilizers
 - Assign risk scores
 - Describe comparative severity of illness
- Identify members not receiving proper care
- Highlight inconsistency of care
- Prospectively identify adverse events
- Allow focused interventions
 - Maximize benefits of disease management
- Discover inefficient care

Additional Uses of Modeling

- Influence adoption of best practices
- Track effectiveness of interventions
- Establish pay for performance
- Set more accurate premiums
- Develop contracts with providers
 - Actuarial
- Help plan network composition
 - Based on member needs

Target Populations

Risk stratify

- Subpopulation
- Risk factors
- Identify most likely to benefit
- Develop specific, targeted interventions
 - Probabilities for certain outcomes
 - Practice guidelines
 - Practice standardization
 - Decrease variation

Modeling Utilizes Available Data

- Traditional demographic data
 - Age, sex, occupation, prior costs
- Clinical data from claims
- Pharmacy data
- Diagnostic tests
- Health risk appraisals
- Questionnaires

Components of Modeling

Entire population data

- Baseline assessment used to predict future
- Risk assessment period
 - Static: year 1 predicts year 2
 - Rolling: assign score every period
- Outcomes of interest
 - Changes in health status
 - Costly healthcare events
 - Overall healthcare expenditures

Statistics in Predictive Modeling

Sensitivity Versus Predictive Value

Score Cut-Point	% True Cases Among Group	% All True Cases Identified
<u> </u>	69%	14%
1ის 2‰	36%	36%
<u> 10 %</u>	25%	51%

Predictive Pos. Value

First Generation Modeling

- Utilize demographic data
 - Age, sex, diagnoses
- Rely upon historical financial data
- Predict risk

Second Generation Modeling

- Utilize first generation data sources
- Incorporate second generation sources
 - Pharmacy data
 - Lab data
 - Test data
- Predictions based on risk adjustment
 - DCGs, ACGs, ETGs

Third Generation Modeling

- Utilize first and second generation sources
- Incorporate other sources and models
 - Health risk appraisals, questionnaires
 - Surveys
 - Regional variability
 - ACGs, DCGs, ETGs
- Model the models
 - Choose the best modeling of models for results
 - Learn from previous data modeling

Third Generation Process

- Perform data cleanup
- Split data into 2 years
- Use Year1 data to predict Year2 cost

Identify modeling clusters and select best drivers

Diseases, enrollment groups, product line

Modeling of Models

Select model for optimum training of each cluster

• Linear & Nonlinear / Regression, Neural Networks....,

Underwriting Impact for Employer Groups

Sample of Employer Group	Members	MEDai forecast \$PMPM	Internal Actuary Premium SPMPM	Difference
Α	80	\$114	\$119	\$6
В	78	\$151	\$139	(\$12)
С	78	\$121	\$149	\$28
D	61	\$167	\$124	(\$43)
E	55	\$114	\$93	(\$21)
F	51	\$145	\$113	(\$32)
G	48	\$170	\$134	(\$36)
н	44	\$111	\$126	\$15
I	41	\$131	\$135	\$5
J	39	\$204	\$168	(\$36)
K	36	\$118	\$124	\$6

• Health plan XYZ compared their premiums for a sample of employer groups using actuary vs. MEDai's.

• The actuarial model underestimated on the majority of small employer groups in comparison to MEDai.

• This creates substantial losses, since 80% of the employers are small-group. The MEDai forecasting provides a savings opportunity that approximated **\$11 million** for 100,000 lives.

• The client states that "in the final quarter of 2001, the actual cost for these groups shows clear underestimation by the internal actuary forecasting." <u>Source: MEDai Inc.</u>

Successful Predictive Modeling

Identify clear goals

- Models fit some better than others
 - Actuarial versus care management
- Assess available data inputs
 - Demographic, claims, pharmacy, lab values
- Secure a product champion
 - Key to any successful implementation
- Apply effective change management
 - Adjustment of approach to care management
