Measuring Patient Activation to Improve Care Transitions

Judith H. Hibbard
Institute for Policy and Research Innovation
University of Oregon

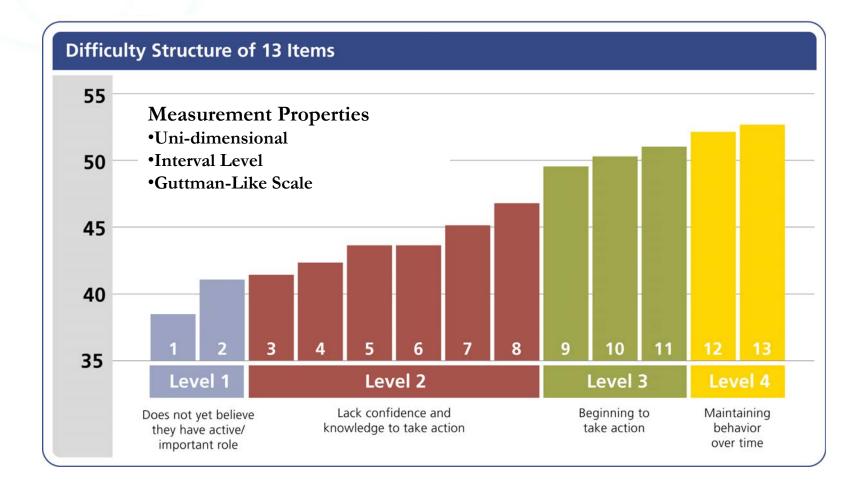

What does it mean to be an engaged activated patient?

- Have the knowledge, skill and confidence to take on the role of managing their health and health care
 - Informed choices
 - Partner in care
 - Self management
- □ NOT ALL PATIENTS ARE THE SAME

When planning for care transitions it is important to know a patient's ability to function in the role we are asking of them

- Measurement can help us:
 - To know who needs more support
 - To target the types of support and information patients need
 - To use our resources more efficiently

Patient Activation Measure™ (PAM) Design Difficulty Structure of 13 Items

Activation is developmental

Level 1

Starting to take a role

Patients do not yet grasp that they must play an active role in their own health. They are disposed to being passive recipients of care.

Level 2

Building knowledge and confidence

Patients lack the basic health-related facts or have not connected these facts into larger understanding of their health or recommended health regiment.

Level 3

Taking action

Patients have the key facts and are beginning to take action but may lack confidence and the skill to support their behaviors.

Level 4

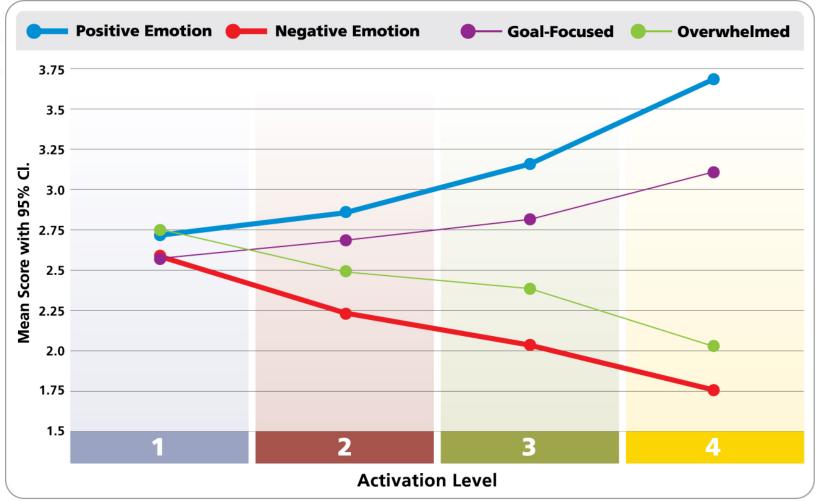

Maintaining behaviors

Patients have adopted new behaviors but may not be able to maintain them in the face of stress or health crises.

Increasing Level of Activation

Emotion plays a profound role in activation

Source: KnowledgeNetworks National Study 2008

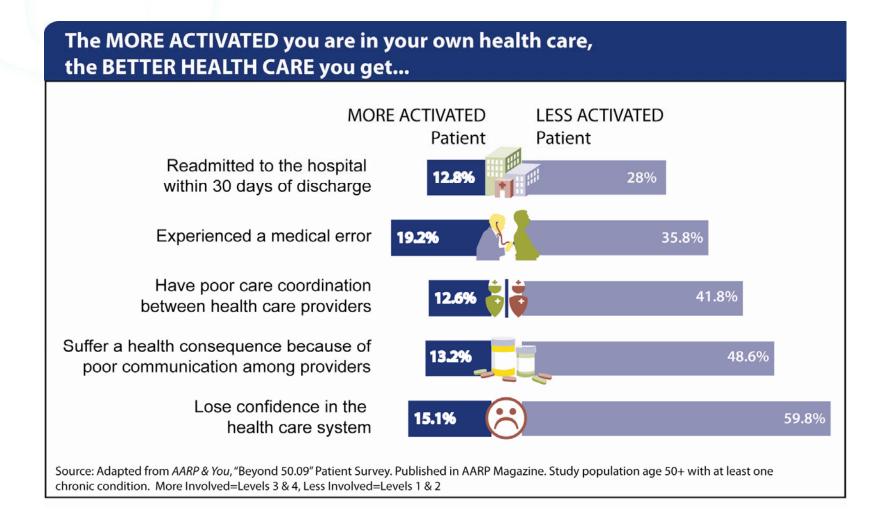

A PAM score is predictive of future utilization and health outcomes

	% change for a 1 point change in PAM score	10 point gain impact 54 (L2) to 64 (L3)
Hospitalization	1.7% decline	17% decreased likelihood of hospitalization
Good A1c control (HgA1c<8%)	1.8% gain	18% greater likelihood of good glycemic control
A1c testing LDL-c testing	3.4% gain	34% improvement in testing

Source: Is Patient Activation Associated with Future Health Outcomes and Healthcare Utilization Among Patient: with Diabetes? Journal of Ambulatory Care Management, Oct/Dec 2009.

Multivariate analysis which controlled for age group, gender, race, comorbidities and number of diabetes-related prescriptions.

Low activation signals problems (and opportunities)

PATIENT ACTIVATION & CARE TRANSITION PILLARS

- Condition knowledge and symptom selfawareness (including Red Flags)
- II. Medication Self-management
- III. Active Participation with Healthcare Providers (including making/keeping appointments)
- IV. Patient use of a PHR

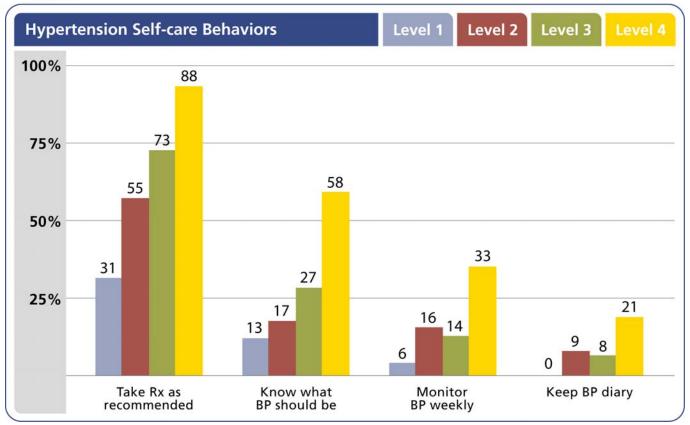

Activation Level is Predictive of Behaviors

Research consistently finds that those who are more activated are:

- Engaged in more <u>preventive behaviors</u>
- Engaged in more <u>healthy behaviors</u>
- Engaged in more <u>disease specific self-</u> <u>management behaviors</u>
- More engaged with <u>interacting with healthcare</u> providers

I. Condition Knowledge/Self-monitoring

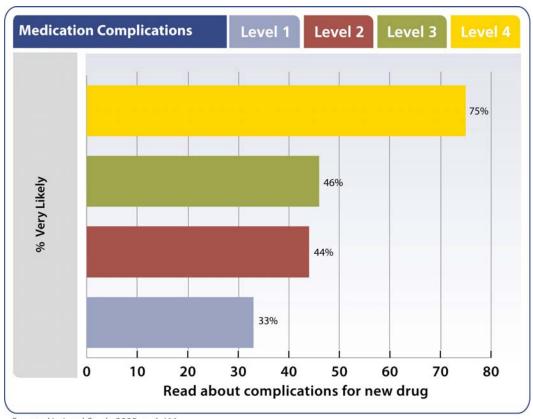

Condition knowledge and self-awareness increases with activation

Source: US National sample 2004

II. Medication Self-Management

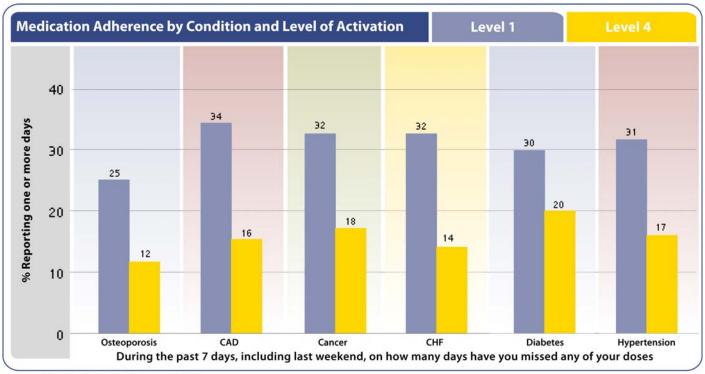

The most activated (and most adherent) are much more likely to understand their medication(s)

II. Medication Self-Management

The lowest activated are twice as likely to miss medication when compared to the highest activated

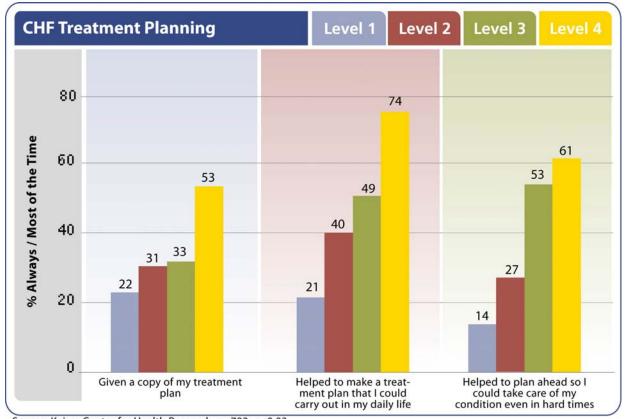

During the past 7 days, including last weekend, on how many days have you missed any of your doses?

Source: Kaiser Center for Health Research 2006

III. Active participation

Patients who get more support from their doctors are more activated

Source: Kaiser Center for Health Research, n=702, p<0.03

Implications

- The low activated are much more likely to be readmitted, to be hospitalized or to use the ED
- Patient Activation score can be used to tailor support during hospitalization and in the post discharge period
 - □ PAM is be used to tailor support in 12 including a number of CMS demo sites
 - Provide more support to low activated
 - Work to reduce feelings of being overwhelmed
